DENTAL INSTRUMENTS

Edition-01

THE EXTENSION OF A DENTIST'S HAND

INTRODUCTION

AR INSTRUMED is located in Sialkot Pakistan having more than 5000 different products in manufacturing. The company has been Manufacturing Dental instruments and exporting to the quality conscious healthcare industry in all over the world. The company prides in its network of wide retailing and its global image of Quality instruments while dealing with international clients which repeatedly stand recognized by government as well as International business standards and Certifications, the company foresees a smiling future in Dental industry. This commitment to excellence has allowed us to establish our customer bases in strategic and vital surgical Hubs of the world.

AR INSTRUMED has other international branches in its network and many distributors worldwide.

AR Instrumed proudly operates a state-of-the-art manufacturing facility, equipped with advanced technology and skilled craftsmanship. The facility is dedicated to producing a comprehensive range of high-quality dental instruments, adhering to EU standards of precision and durability. The facility employs a highly trained workforce that specializes in crafting instruments with meticulous attention to detail, ensuring every product meets stringent quality control measures.

From raw material selection to final inspection, the entire production process is conducted in-house, enabling the company to maintain consistency and excellence in its offerings. AR Instrumed's manufacturing unit not only supports the local economy by creating employment opportunities but also contributes to the global healthcare industry by supplying premium instruments to clients worldwide. The facility is certified by renowned international regulatory bodies, reflecting its commitment to compliance and quality assurance.

By combining traditional expertise with innovative technology, the manufacturing facility is a cornerstone of AR Instrumed's global operations, ensuring the delivery of reliable, high-performance instruments to healthcare professionals around the globe.

CNC Machining Department

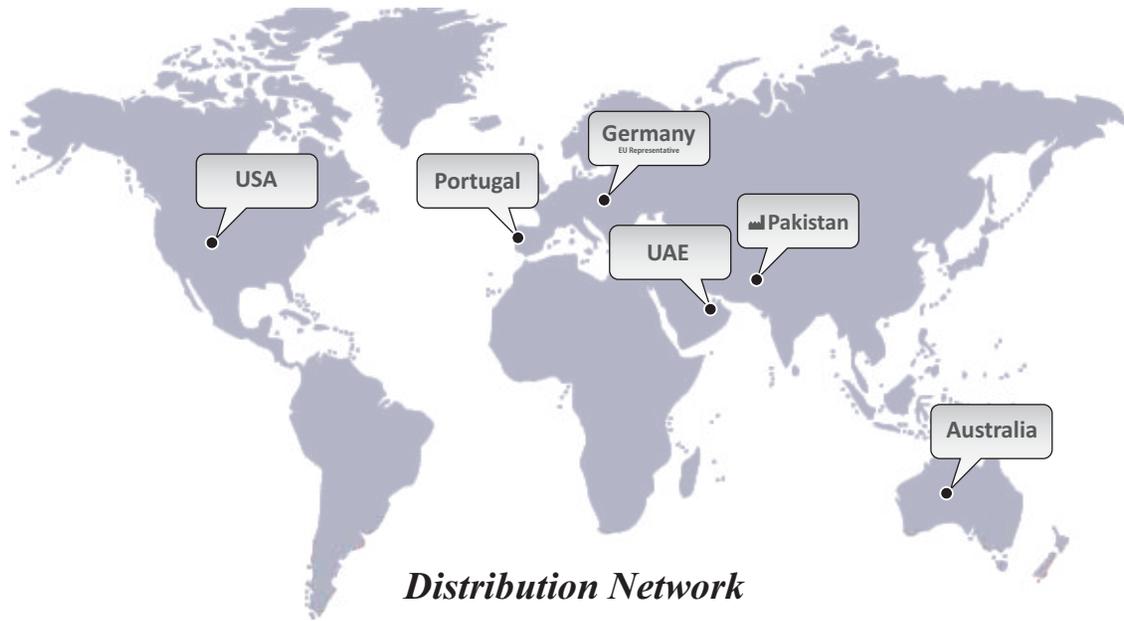

Revolutionizing dentistry through worldwide exhibitions and innovation.

REDEFINING COMFORT AND EFFICIENCY EXPERIENCE THE DIFFERENCE OF INNOVATION
PRECISION IN EVERY SHADE
AVAILABLE IN A RANGE OF VIBRANT COLOURS

PACKAGING

SILICONE INSTRUMENTS IN DURABLE BLISTER PACKAGING FOR ENHANCED PROTECTION AND EXTENDED SHELF LIFE.

Warranty Policy and Cleaning Instructions

Warranty Policy

AR INSTRUMED products are warranted against defects in workmanship and materials. Defective items will be repaired or replaced at no charge. Additional shipping charges may apply for returns, as noted on the invoice.

Cleaning Instructions

Ultrasonic Cleaning

Ultrasonic cleaning is the most effective method for cleaning surgical instruments, particularly those with hinges, box locks, and other moving parts.

- 1. Pre-Wash:** Instruments must be pre-washed before being fully submerged in an open position with distilled water and ultrasonic cleaning solution.
- 2. Rinse:** Always rinse the ultrasonic cleaning solution off instruments with distilled water prior to sterilization.

Staining Prevention

Staining is often mistaken for rust and is typically a surface deposit on instruments. Here are common causes and suggestions for avoiding staining:

- **Orange/Brown Stains:** Often caused by a phosphate layer from water sources, detergents, surgical wrappings, cold sterilization solutions, or dried blood.
- **Black Stains:** Commonly result from acid reactions or detergents with a high pH.
- **Dark Brown Stains:** Usually due to dried blood left on the instrument, which should be removed immediately to prevent damage to the instrument's surface.

Warranty Policy

- **Normal Wear and Tear:** Warranty does not cover normal wear and tear or use beyond the intended limitations of the instrumentation.
- **Improper Usage:** Warranty is voided if the instrument is used improperly or in a manner not intended by the design.
- **Damage:** Instruments damaged through abuse or accidental means are excluded from the warranty.
- **Storage and Sterilization:** Warranty is void if instruments are not stored and sterilized properly, as outlined in the Instrument Care section.
- **Modifications:** Any modification, alteration, or sharpening of AR INSTRUMED instruments will void the warranty.

Manual Cleaning

If ultrasonic cleaning isn't available, manually clean instruments with nylon or stainless steel brushes and a mild surgical detergent.

Important: Do not use steel wool or scouring pads. Always rinse with distilled water before sterilization.

ASTM Standards and Manufacturing Process

ASTM Standards

AR INSTRUMED adheres to international standards during manufacturing. Below is a list of the relevant ASTM standards we follow to ensure the quality and safety of our products:

- **Quality Stainless Steel:** Manufactured according to ASTM standard F899-95 & ISO 713501.
- **Corrosion Resistance:** Complies with ASTM standard F1089-02 for surgical instruments.
- **Passivation:** Follows ASTM standard B967-05 for passivation processes.
- **Electropolishing:** Conducted as per ASTM standard B912-02.
- **Rockwell Hardness Testing:** In accordance with ASTM standard E18-00.
- **Cleaning and Descaling:** Performed according to ASTM standard A380-99 (R05).
- **Material Selection:** Proper grade selection from AISI 410, 420, and AISI 304 is based on guidelines from ASTM standards.

Manufacturing Process

Our manufacturing process involves skilled technicians and advanced techniques to ensure the highest quality instruments:

- 1. Tip Shaping:** Each tip is carefully shaped by skilled technicians using CNC machinery.
- 2. Bending:** Tips are bent 1 to 6 times to ensure optimal usability and performance.
- 3. Heat Treatment:** Instruments undergo heat treatment processes to enhance strength, achieving a hardness rating of 50-55. This increases material durability and minimizes wear.
- 4. Assembly:** Proper assembly is crucial. Each tip is inserted into the handle by highly trained technicians to ensure it functions correctly and does not break or fall out.
- 5. Final Cleaning and Sharpening:** All instruments are thoroughly cleaned and undergo a final sharpening process, known as "blading," to ensure they meet the specifications required by dental professionals.

Quality Assurance

To maintain high standards, we implement rigorous quality control measures throughout the manufacturing process, including:

Inspection: Each instrument is inspected for defects before packaging.

Testing: Instruments undergo performance testing to ensure they meet established criteria.

Documentation: Detailed records of manufacturing processes and inspections are maintained for traceability.

Handle Manufacturing Process and Operating Manual

Handle Manufacturing Process

AR INSTRUMED employs meticulous techniques in the manufacturing of instrument handles to ensure quality and usability:

- 1. Precision Cutting:** Each handle is cut to size using precision machinery to accommodate various instrument sizes.
- 2. Complete Handle Assembly:** The tip is carefully cut to fit the corresponding handle size, requiring precision to minimize product loss.
- 3. Grooving:** Handles are grooved to enhance comfort for dental professionals during treatment. The grooving pattern varies based on the function and type of handle.
- 4. Upscale Satin Finish:** Handles are polished to a bright satin finish by applying friction in a sand barrel over an extended period.
- 5. Ultrasonic Cleaning:** To prevent rust and extend the lifespan of the instruments, ultrasonic cleaning is essential. Without this process, handles may deteriorate more quickly.

Operating Manual (Instructions for Use)

Device: Stainless Steel Dental Instruments

Before using the instruments, please read the following instructions carefully. Each AR INSTRUMED instrument is produced with precision and professionalism, designed specifically for qualified specialists.

Preparation Before Use

- **Non-Sterilized Delivery:** Instruments are delivered non-sterilized. It is crucial to wash, rinse, and thoroughly sterilize them before use.
- **Cleaning Residues:** Multi-part instruments, such as scissors, may have oil residues from production. Ensure proper cleaning before use.

Warnings

Never:

- Misuse instruments or overstrain joints, racks, or connections.
- Use abrasives on instruments, as this can damage the surface finish, leading to discoloration, rust, or pitting.
- Handle instruments by their tips; only trained personnel should clean them to protect delicate working ends during storage and sterilization.
- Use general-purpose oils; only water-soluble lubricants should be applied.
- Soak instruments longer than necessary in chemical sterilizing solutions. After sterilization, wash thoroughly in warm water to remove chemical traces and prevent discoloration or pitting.
- Store damp instruments; ensure they are completely dried before storage.

Instructions, Precautions, and Maintenance

To ensure the longevity and effectiveness of your AR INSTRUMED instruments, please follow these instructions and precautions carefully.

Instructions and Precautions

Never:

- Lubricate instruments after cleaning with anything other than a proprietary water-soluble instrument lubricant.
- Use Corrosive Cleaning Agents: Follow the approved cleaning procedures of your hospital or clinic. We recommend cleaning solutions and rinses with a pH of 7.0.
- Use Abrasive Cleaners or Hard Brushes: Avoid brushes with hard bristles (not made of metal) as they can damage the instruments.

Cleaning After Use:

- **Immediate Cleaning:** After use, promptly remove all debris (e.g., tissue, blood, cement) from the instruments using proven disinfectant solutions to avoid mechanical damage.
- **Rinsing:** Use only distilled water for rinsing. Water with chloride content may damage or destroy the instruments.
- **Avoid Prolonged Soaking:** Do not leave instruments in cleaning or disinfecting solutions for extended periods (e.g., overnight or over the weekend), this can cause damage.

Handling:

- Ensure that all instruments are used only for their intended purpose. Handle them gently and never overstrain, drop, or misuse them.
- **Damage Inspection:** Check all instruments for damage after use. Pay special attention to microsurgical instruments, as their fine tips can easily be damaged by contact with other instruments or the sides of storage cases.

Drying and Storage:

- **Thorough Drying:** Ensure all instruments are completely dried before storage.
- **Careful Packing:** Pack instruments carefully, placing heavier ones on a cloth or towel at the bottom.
- **Special Storage for Bow-Handled Instruments:** Store and sterilize bow-handled instruments on a designated holder, and always leave racks and ratchets open.

Water Quality:

- **Check Water Hardness:** Ensure the hardness of the water used in the autoclave is appropriate. Too hard water can leave deposits on instruments.
- **Water Softeners:** If using a water softener, ensure it is set to the manufacturer's recommended level. Excessive softening can lead to discoloration or pitting.

Sterilization Guidelines

The primary goal of steam sterilization is to ensure the effective sterilization of instruments without compromising their structural or functional integrity. This process must be performed by trained specialists following the guidelines set forth in DIN EN 285 and DIN EN 554.

Steam Sterilization

Autoclave sterilization using saturated steam is the most common method today. This process relies on the heat necessary for sterilization and the pressure of water, which increases the latent heat of vaporization.

Recommended Practices:

- **Temperature and Time:**
 - Do not exceed a sterilization temperature of 137 °C.
 - Use cycles that do not exceed 7 minutes at 134 °C and a pressure of 2.1 bar.
- **Packaging:**
 - Each instrument must be securely packaged with welding seams before sterilization.
 - Fill the autoclave with packaged materials, ensuring that water vapor can penetrate freely.
- **Post-Sterilization:**
 - After the sterilization cycle, check the process parameters and inspect the indicator strip.
 - If the process is not successful, reprocess the instruments.
 - Ensure that no water remains in the packaging after sterilization, as residual moisture can lead to corrosion, oxidation, or bacterial growth.

Dry Heat Sterilization

Excessive temperatures (above 177 °C) during dry heat sterilization can weaken the hardness and cutting performance of instruments, particularly cutting instruments which may lose sharpness. Darkening and brown spots resembling oxidation may also occur.

Recommended Practices:

- **Sterilization Conditions:**
 - Instruments can be sterilized at 170 °C for at least 60 minutes.
 - Alternatively, sterilize at 160 °C for a minimum of 120 minutes.

Special Considerations for Aluminum and Titanium Instruments

- **Avoid Heat Exposure:** Do not place aluminum or titanium instruments in heating systems or ultrasonic baths.
- **Cleaning:** Use only substances specifically recommended for cleaning aluminum and titanium instruments.

Storage, Calibration, Disposal, and Returns

The primary goal of steam sterilization is to ensure the effective sterilization of instruments without compromising their structural or functional integrity. This process must be performed by trained specialists following the guidelines set forth in DIN EN 285 and DIN EN 554.

Storage Guidelines

To ensure the longevity and effectiveness of your AR INSTRUMED instruments, please follow these storage guidelines:

- **Dry Environment:** Store instruments in a dry place.
- **Proper Packing:** Pack instruments carefully, placing heavier instruments at the bottom and lighter instruments on top to avoid damage.
- **Protection from Elements:** Sterile, packaged instruments should be stored in a manner that protects them from dust, moisture, insects, vermin, and extreme temperatures.
- **Special Attention:** Pay particular attention to microsurgical instruments, as their fine tips can be easily damaged by weight or contact with other instruments and their storage cases.

Calibration

No Calibration Required: AR INSTRUMED products do not require calibration.

Disposal

Recyclable Materials: Surgical instruments do not contain toxic or hazardous materials, and their stainless steel composition makes them recyclable at ordinary steel manufacturing facilities. No special decomposition or disposal procedures are required.

Returns

Return Policy: In case of damage or defects, please return the instruments to the supplier using the original packaging and provide a detailed description of the issue.

Expected Patient Age Group

Universal Use: The products are suitable for all age groups.

Contraindications

No Contraindications: There are no known contradictions associated with the use of these instruments.

Limitations of Warranty

AR INSTRUMED is not responsible for the following cases:

1. Damages resulting from improper use of the instrument.
2. Damages arising from incorrect cleaning and/or sterilization processes.
3. Damages caused by storing instruments in unsuitable locations.
4. Damages due to lack of maintenance, particularly for joint instruments that require regular lubrication.

When looking for black coatings for Swiss steel with a hardness of HRC 60, there are several options depending on the specific performance requirements, such as wear resistance, corrosion protection, and friction reduction. Here's a breakdown of suitable black coatings that work well with Swiss steel at that hardness level:

Purpose: Provides enhanced corrosion resistance, wear resistance, and an aesthetically pleasing black finish.
Compatibility: Works well on steels with hardness up to HRC 60, including Swiss steel, providing a thin, non-reflective finish.

Process: Black oxide is achieved through a chemical process that forms a thin, protective oxide layer on the steel's surface. This layer is not as thick as other coatings like PVD or DLC but offers good protection against rust and wear in mild environments.

Benefits:

Corrosion Resistance: Helps prevent oxidation and rust.

Lubrication: Retains lubricants better than untreated steel, making it useful for reducing friction between moving parts.

A **Filling Instruments** With a **Silicone Handle** is a Variation of The Standard Filling Instruments, Designed With a Handle Made From Silicone For Improved Ergonomics and Comfort During Dental Procedures. The Key Difference is The Silicone Handle, Which Offers Several Benefits Over Traditional Metal or Plastic Handles.

key Features of a Filling Instruments With Silicone Handle:

Silicone Handle Ergonomic: Silicone Provides a Comfortable And Non-slip Grip, Reducing Hand Fatigue During Extended Procedures.

Antimicrobial Properties: Many Silicone Handles Are Designed With Antimicrobial Properties, Helping To Reduce The Risk of Cross-Contamination During Surgeries.

Benefits of a AR Light Silicone Handle:

Comfort: Silicone Handles are often **Softer And Light Weight** Provide A Better Grip, Reducing The Likelihood of Hand Cramps or Fatigue During Long Surgeries.

Improved Control: The Non-slip Quality of Silicone Ensures Better Control of The Tool, Especially In Wet or Slippery Conditions (like Those That Occur During Surgeries).

Durability: Silicone is Resistant To Wear and Tear, Making It A Long-lasting Material For Dental Tools.

Safety: The Handle Is Typically More Resistant To Bacterial Growth Compared To Other Materials, Offering Enhanced Hygiene During Surgeries.

Soft and Comfortable Grip
Ergonomics: Light silicon handles are designed to be soft to the touch, providing a comfortable and ergonomic grip. This reduces hand fatigue and enhances comfort during long procedures, making the instruments easier to hold for extended periods.

Reduced Hand Strain: The soft, flexible nature of silicon reduces the pressure on the hands and fingers, minimizing the strain that can occur with harder, non-ergonomic handles.

Improved Grip and Control
Non-Slip Surface: Silicon offers excellent grip, even when wet. This is especially important in a dental environment where instruments may come into contact with saliva or water. The grip ensures that the dental professional can handle the tools with precision and control, improving overall efficiency during procedures.

Enhanced Dexterity: The ergonomic and grippy nature of the silicon handle helps the dentist or hygienist to better manipulate the tool, making tasks like scaling, filling, and other detailed work much easier.

Light Weight
Reduced Fatigue: Dental instruments with light silicon handles are less likely to cause fatigue compared to heavier metal handles. This is important in procedures that require fine motor skills and delicate movements, as the dentist can focus on the procedure without worrying about the weight of the instrument.

Better Mobility: The lighter weight contributes to better maneuverability, especially during intricate tasks where precision is essential, like in restorative or Dental instruments procedures.

AR SOFT

Introducing The Dental **AR Soft Handle** Root Elevator, An Essential Tool For Dental Professionals.

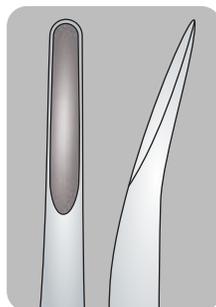

AR Soft Handle Root Elevator Is Designed For Efficient Tooth Extraction And Root Separation. Its Ergonomic Soft Handle Provides a Comfortable Grip, Reducing Hand Fatigue During Dental Procedures.

The Precision-Engineered Blade Allows For Optimal Access To Root Structures, Facilitating Effective Elevation And Extraction While Minimizing Trauma To Surrounding Tissues.

Grip Better, Work Better

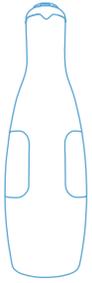

Experience unparalleled comfort and control with the all-new **AR Soft** handle.

Designed with a durable plastic base and a premium silicone layer on top, this ergonomic innovation provides a secure, slip-resistant grip for precision and ease during procedures.

The soft-touch surface reduces hand fatigue, ensuring optimal performance even during extended use.

Elevate your practice with **AR Soft** – where innovation meets functionality.

Built for Strength and Durability
Engineered for demanding procedures, the tough thick serrations on AR Soft Elevators provide unmatched strength and reliability.

These robust serrations ensure a firm grip on even the most challenging surfaces, delivering exceptional control and stability.

Designed to withstand high-pressure applications, they offer long-lasting performance and consistent results.

Trust in the durability and efficiency of thick serrations to handle the toughest tasks with ease and precision

Fine Serrated Points-Precision Redefined

The **AR Soft** Elevators feature fine serrated points meticulously designed for enhanced grip and accuracy.

These serrations ensure a secure engagement with the tooth surface, minimizing slippage and improving control during delicate procedures.

Engineered for superior performance, the fine serrated points aid in efficient tooth elevation, reducing effort while maintaining precision.

Intraligamentary Syringe

The Anesthesia Intraligamentary allows to inject the anesthetic directly into the ligament of the tooth so that ensure the rapid and total anesthesia only the affected tooth without having to anesthetize instead more generically an area as happens with normal anesthesia.

Product Features

Tip angle of 45 ° in order to make more convenient the operativity.

Insert anesthetic with finest

Handle with lever dosage convenient to work in both the top and the bottom of the oral cavity

Processing much less traumatic than to classical anesthesia.

Less quantities of anesthetic given for each dose 0.06 ml for single push

Advantages

Quick effect of anesthetic

Eliminated the risk hematoma formation

Plus possibility of processing of teeth located in different position.

*Effect of anesthetic circumscribed even just at a single element to be treated.
Easy to operate.*

A **Periosteal Elevator** With a **Silicone Handle** is a Variation of The Standard Periosteal Elevator, Designed With a Handle Made From Silicone For Improved Ergonomics and Comfort During Dental Procedures. The Key Difference is The Silicone Handle, Which Offers Several Benefits Over Traditional Metal or Plastic Handles.

key Features of a Periosteal Elevator With Silicone Handle:

Silicone Handle Ergonomic: Silicone Provides a Comfortable And Non-slip Grip, Reducing Hand Fatigue During Extended Procedures.

Antimicrobial Properties: Many Silicone Handles Are Designed With Antimicrobial Properties, Helping To Reduce The Risk of Cross-Contamination During Surgeries.

Benefits of a Silicone Handle:

Comfort: Silicone Handles are often Softer And Provide A Better Grip, Reducing The Likelihood of Hand Cramps or Fatigue During Long Surgeries.

Improved Control: The Non-slip Quality of Silicone Ensures Better Control of The Tool, Especially In Wet or Slippery Conditions (like Those That Occur During Surgeries).

Durability: Silicone is Resistant To Wear and Tear, Making It A Long-lasting Material For Dental Tools.

Safety: The Handle Is Typically More Resistant To Bacterial Growth Compared To Other Materials, Offering Enhanced Hygiene During Surgeries.
